

AI Questions

1. What is Artificial Intelligence?

Artificial Intelligence (AI) is a technology that enables machines or computers to simulate human intelligence such as learning, reasoning, problem-solving, and decision-making.

2. What are the types of AI?

There are mainly 3 types:

- 1. **Narrow AI** – Performs specific tasks (Example: Chatbots, Google Assistant)
 - 2. **General AI** – Can perform any human-level task (still under research)
 - 3. **Super AI** – More intelligent than humans (theoretical)
-

3. What is Machine Learning?

Machine Learning (ML) is a subset of AI where machines learn patterns from data and improve automatically without being explicitly programmed.

4. Difference between AI, ML, and Deep Learning?

AI	ML	Deep Learning
Broad concept	Subset of AI	Subset of ML
Mimics human intelligence	Learns from data	Uses neural networks
Example: Chatbot	Spam Detection	Face Recognition

5. What is Deep Learning?

Deep Learning is a type of Machine Learning that uses neural networks with multiple layers to process complex data like images, speech, and videos.

6. What is Generative AI?

Generative AI creates new content such as text, images, code, or audio based on learned patterns from data.

Example:

- ChatGPT → Text generation
 - DALL·E → Image generation
-

7. What is a Neural Network?

A Neural Network is a model inspired by the human brain that processes information using interconnected nodes called neurons.

8. What is NLP?

NLP (Natural Language Processing) is a branch of AI that helps computers understand and process human language.

Examples:

- Chatbots
 - Language Translation
 - Sentiment Analysis
-

9. What is Computer Vision?

Computer Vision enables computers to understand images and videos.

Examples:

- Face detection
 - Self-driving cars
 - Medical image analysis
-

10. What is supervised learning?

In supervised learning, the model is trained using labeled data.

Example:

- Email spam detection
-

11. What is unsupervised learning?

In unsupervised learning, the model finds hidden patterns from unlabeled data.

Example:

- Customer segmentation
-

12. What is reinforcement learning?

A learning method where an AI agent learns through rewards and penalties.

Example:

- Game-playing AI
 - Robotics
-

13. What is a dataset?

A dataset is a collection of data used for training and testing AI models.

14. What is training in AI?

Training means teaching the AI model using data so it can make predictions or decisions.

15. What is overfitting?

Overfitting happens when a model memorizes training data and performs poorly on new data.

16. What is underfitting?

Underfitting occurs when the model cannot learn the data properly and gives poor results.

17. What is a chatbot?

A chatbot is an AI application that communicates with users using text or voice.

Example:

- ChatGPT
 - Customer support bots
-

18. What is RAG in AI?

RAG (Retrieval-Augmented Generation) combines information retrieval with generative AI to provide accurate answers from external data sources.

19. What is an AI Agent?

An AI Agent is an intelligent system that can make decisions, use tools, and complete tasks automatically.

20. What is Prompt Engineering?

Prompt Engineering is the process of designing effective inputs/prompts to get better responses from AI

21. Agentic ai?

Agentic AI is an advanced type of AI that can think, plan, decide, and perform tasks autonomously with minimal human intervention.

Unlike normal AI systems that only respond to commands, Agentic AI can:

- Understand goals

- Make decisions
- Use tools/APIs
- Remember previous steps
- Execute multiple tasks automatically
